GUI (Graphical User Interface) and CLI (Command Line Interface) use different techniques to accomplish the same tasks.

GUI uses a mouse to point and click to launch programs, move, copy or rename files and folders. It is very visually oriented with menus and multiple choices.

Using the CLI, the user must type in the commands to do the same tasks, such as MD to make a directory (or folder), del to delete files, etc.

Note that different CLI's will use different commands to do the same tasks.

Sometimes the CLI gives you output after running a command, but not always.
